NEW FORMULATION**Field of the invention**

- 5 The present invention relates to new oral pharmaceutical dosage forms comprising as active ingredient omeprazole, an alkaline salt of omeprazole, S-omeprazole or an alkaline salt of S-omeprazole. The dosage form comprises a core material of the active ingredient, one or more alkaline additives, and one or more swelling agents, wherein the core material is covered with a semipermeable membrane. Furthermore, the invention refers to the
10 manufacture of such dosage forms and their use in medicine.

Background of the invention and prior art.

The acid labile H⁺, K⁺-ATPase inhibitor known under the generic name omeprazole is
15 disclosed in EP-0005129. Certain salts of omeprazole are described in EP-124495, a magnesium salt of omeprazole is described in WO 95/01977, and the single enantiomers of omeprazole and certain salts thereof are described in WO 94/27988.

Omeprazole is useful for inhibiting gastric acid secretion in mammals including man by
20 controlling gastric acid secretion at the final step of the acid secretory pathway and thus reduce basal and stimulated gastric acid secretion irrespective of stimulus. In a more general sense, omeprazole may be used for prevention and treatment of gastric-acid related diseases in mammals and man, including e.g. reflux oesophagitis, gastritis, duodenitis, gastric ulcer, duodenal ulcer and Zollinger-Ellison syndrome. Furthermore, it may be used
25 for treatment of other gastrointestinal disorders where gastric acid inhibitory effect is desirable e.g. in patients on NSAID therapy, in patients with Non Ulcer Dyspepsia, and in patients with symptomatic gastro-oesophageal reflux disease (GORD). Omeprazole may also be used in patients in intensive care situations, in patients with acute upper gastrointestinal bleeding, pre-and post-operatively to prevent aspiration of gastric acid and
30 to prevent and treat stress ulceration. Further, it may be useful in the treatment of psoriasis

as well as in the treatment of *Helicobacter* infections and diseases related to these where therapeutic control of gastric acid secretion is fundamental in the treatment.

Omeprazole is, however, susceptible to degradation or transformation in acidic and neutral media. The stability of omeprazole is also affected by moisture, heat, organic solvents and to some degree by light. With respect to the stability properties of omeprazole, it is established that an oral solid dosage form must be protected from contact with the acidic gastric juice and that omeprazole must be transferred in intact form to that part of the gastrointestinal tract where pH is near neutral and where rapid absorption can occur.

10

- A pharmaceutical dosage form of omeprazole is best protected from contact with acidic gastric juice by an enteric coating layer. For instance, US 4,786,505 describes such enteric coated formulations. These formulations have a core comprising an alkaline salt of the drug or a core comprising the drug together with an alkaline reacting compound, the core is coated with a water soluble or in water rapidly disintegrating separating layer and then with an enteric coating layer. There are numerous published patent applications from different companies describing enteric coated formulations comprising omeprazole or other proton pump inhibitor compounds.
- 20 WO 96/01623 describes tableted dosage forms of omeprazole, wherein enteric coating layered pellets are compressed into a multiple unit tableted dosage form. It is essential in these tableted formulations that the enteric coating layer can withstand the compression forces.
- 25 There are different technologies and pharmaceutical formulations described in the prior art which provide a delayed release of an administered drug. Such formulations are for instance based on osmotic differences, slow-eroding/dissolving layers, diffusion through a membrane, time controlled explosion systems or any combinations thereof. In the following some of these principles are exemplified. For instance, US 4 871 549 describes a
- 30 time controlled explosion system. Conte et al (Drug Development and Industrial

Pharmacy, 1989, vol. 15, pp. 2583–96) describes a three-layer tablet giving a double pulsed system suitable for ibuprofen. US 5 567 441 describes a dosage form for diltiazem comprising a mixture of one fraction of slow release pellets and another fraction of delayed pulse release membrane coated pellets. WO97/02020 describes a dosage form of 5 pantoprazole in combination with antibacterial substances wherein one part of the pantoprazole dose is in slow release form with a continuously release during time. US 5 178 867 describes a dosage form with an exit port or hole that connects the interior of the dosage form with the exterior.

10 Summary of the invention

The present invention provides – in contrast to earlier presented oral dosage forms for proton pump inhibitor compounds – a dosage form without an enteric coating layer.

15 The dosage form according to the present invention comprises a core material coated with a semipermeable membrane. The core material contains an active ingredient selected from omeprazole, an alkaline salt thereof, S-omeprazole or an alkaline salt thereof, one or more alkaline additives, and one or more swelling agents. The semipermeable membrane may disrupt or may change its permeability after a pre-determinated time. One or more swelling 20 agents are placed inside the membrane to effectuate a disruption or an increased permeability of the membrane after such a suitable time. Optionally pharmaceutically acceptable excipients such as an osmotic agent may also be included in the core material.

Surprisingly, the formulation according to the present invention can be prepared without 25 the need of an enteric coating, which previously have been almost an axiom for dosage forms containing omeprazole or any other proton pump inhibitor compounds. By providing an alternative to the enteric coating layer, the present invention also provides the possibility to avoid the need for a separating layer beneath the enteric coating layer separating the acid-sensitive omeprazole from the enteric coating polymer. Contact 30 between omeprazole and the enteric coating layer should preferably be avoided due to

discoloration and degradation of omeprazole. Thus, the present invention provides a manufacture that may be simplified by fewer processing steps than previous manufacture processes requesting double coating layers on the core material. See for instance, EP 247 983.

5

According to a further aspect of the present invention, the dosage form may preferably be in the form of a multiple unit pellet system. The prepared pellets layered with a semipermeable membrane may be filled into a capsule or compressed into a multiple unit tablet.

10

The core material comprises an alkalizing agent, which is sufficiently strong and which is present in sufficiently high amounts. The core material also comprises a swelling material that upon contact with moisture starts to swell. When the individually layered pellets pass the stomach small amounts of gastric fluid will be absorbed through the semipermeable membrane. The alkalizing agent in the core material will neutralize the absorbed acidic fluid and protect the active ingredient against degradation. At the same time the swelling material, will be exposed for the penetrating fluid or moisture and will start to expand. After a chosen time interval this expansion leads to disruption of the superimposed semipermeable membrane by the built-up pressure or to a swelling that will increase the permeability of the membrane. The time interval is to be chosen so that the pellets have passed the stomach at that very moment, and have reached the small intestines. The dose of omeprazole or S-omeprazole will then start to be released into the small intestine where absorption can occur.

25 Detailed description of the drawings

Figures 1 – 4 illustrate construction principles for the present invention. The invention comprises a core material layered with a semipermeable membrane. The core material can be prepared according to at least four possibilities as shown in the Figures. The drawings 30 are not illustrating the size of the respective parts of the dosage forms.

1999-06-22

Detailed description of the invention

The present invention provides a core material in the form of pellets or small tablets
5 coating layered with a semipermeable membrane. The semipermeable coating and the composition of the core material protect the active ingredient in the pellets against the incoming permeated gastric fluid during the passage through the stomach. Such pellet formulations are generally emptied from the stomach within 2-4 hours. When the pellets have departed from the stomach, the pellet membrane disrupts and/or starts to release the
10 active ingredient in the small intestine.

The coated pellets may be filled into capsules of gelatine or hydroxypropyl methylcellulose (HPMC), be filled into sachets or be mixed with tablet excipients and compressed to a fast disintegrating tablet or to an effervescent tablet.
15

Core material

The core material may be produced with starter seeds, for instance sugar spheres like NonpareilsTM, by layering technique or in a centrifugal granulator/ roto granulator.
20 Alternatively, the core material has a homogenous distribution of the active agent, and is prepared e.g. by extrusion and spheroidization, or by compression. Other conventional and known techniques are also suitable in preparing the core material.

The core material is in the form of pellets, spheroids or small tablets. The size of the
25 formulated core materials is approximately between 0.1 and 4 mm, and preferably the core material has a diameter of 0.2 to 2.5 mm.

The core material comprises an active ingredient, an alkalizing agent, a swelling agent and optionally binders, osmotic agents and other pharmaceutically acceptable excipients.
30

1999-06-22

The active ingredient is selected from the group consisting of omeprazole, an alkaline salt thereof, S-omeprazole or an alkaline salt thereof. Suitable alkaline salts are for instance the Mg^{2+} , Ca^{2+} , Na^+ , K^+ salts, preferably the Mg^{2+} salts in a highly crystalline form. A preferred magnesium salt of omeprazole having a crystallinity of more than 70% determined by X-ray powder diffraction is described in WO95/01977.

Before the seeds are layered, the active substance may be mixed with further components to obtain preferred handling and processing properties and a suitable concentration of the active substance in the final mixture.

Such components can be binders, surfactants, fillers or other pharmaceutically acceptable ingredients, alone or in mixtures. The binders are for example celluloses such as hydroxypropyl methylcellulose, methylcellulose, hydroxypropyl cellulose and carboxymethyl-cellulose sodium, polyvinyl pyrrolidone, gelatine, sugars, starches and other pharmaceutically acceptable substances with cohesive properties. Suitable surfactants are found in the groups of pharmaceutically acceptable non-ionic surfactants, such as polysorbate 80, or ionic surfactants such as for instance sodium lauryl sulphate.

An alkalinizing agent is comprised in the core material together with the active ingredient and/or the swelling agent, preferably together with the active agent. The alkalinizing agent is present in an amount of approximately 5 to 35 % w/w in the core material, preferably 10 to 35 % w/w, or most preferably 15 to 35 % by weight calculated on the weight of the core material excluding the weight of the possible starter seed.

The alkalinizing agent is selected from compounds like disodium hydrogen phosphate, trisodium phosphate, arginine or talc etc, provided that they give a pH of not less than 8.5 when measured in a 2% w/w water solution/dispersion with a pH-measuring electrode. At least one alkalinizing agent has to be incorporated in the core material, but also any combinations of alkalinizing agents can be used.

The swelling agent is preferably selected among crosslinked polyvinyl pyrrolidone, crosslinked sodium carboxymethylcellulose, sodium starch glycolate or low-substituted hydroxypropyl cellulose (L-HPC), alone or in any combinations. The amount of swelling agent is chosen to effectuate the start of dissolution of the core material at a proper time.

5 Preferably the core material comprises approximately 20 to 60 % by weight of the swelling agent calculated on the weight of the core material excluding any possible inert starting seed. More preferably a concentration of 25 to 55 % by weight, or especially 30 to 50 % by weight of the swelling agent calculated in the same manner.

10 Alternatively, the swelling agent or a portion of the swelling agent may optionally be incorporated in a separate layer, which layer also comprises binders and optionally an alkalinizing agent and/or pharmaceutically acceptable excipients.

15 Optionally an osmotic agent is placed in the core material. Such an osmotic agent is watersoluble and will provide an osmotic pressure in the tablet. Examples of osmotic agents are magnesium sulphate, sodium chloride, lithium chloride, potassium chloride, potassium sulphate, sodium carbonate, lithium sulphate, calcium bicarbonate, sodium sulphate, calcium lactate, urea, magnesium succinate, sucrose or mixtures thereof.

20 Alternatively, the active substance optionally mixed with any of the components defined above can be formulated into a core material. Said core material may be produced by extrusion/spheronization, balling or compression utilizing different process equipments. For extrusion/spheronization processes incorporation of a microcrystalline cellulose and a low-substituted hydroxypropylcellulose in the core material is preferred.

25

Semipermeable membrane.

The membrane comprises a water insoluble polymer and a modifying additive and optionally pharmaceutically acceptable excipients like fillers, colorants etc. The excipients

8 1999 -06- 22

should be insoluble or hardly soluble in acidic solutions, or present in amounts not influencing the solubility properties of the membrane.

Such a water insoluble polymer may be selected among semipermeable water insoluble
5 polymers like ethylcellulose, cellulose acetate, polyvinyl acetate, and ammonio
methacrylate copolymer type A and type B (Eudragit RL, Eudragit RS) etc.

The modifying agent in the semipermeable membrane may be a talc or fumed silica (e.g.
Aerosil or Cab-O-Sil.). Preferably talc is used as the modifying agent.

10 The amount of modifying agent to water insoluble polymer on a weight to weight ratio in
the membrane is from 90:10 up to 50:50. Preferably the modifying agent to water insoluble
polymer on a weight to weight ratio in the membrane is from 80:20 up to 60:40.

15 Final dosage form

The prepared coated core material is filled into a capsule (gelatine or HPMC capsule), or
optionally mixed with tablet excipients and compressed into a multiple unit tableted dosage
form. In the expression "tablet excipients" is also effervescent tablet excipients included
20 with respect to multiple unit tablets. Prepared tablets are optionally covered with
filmforming agent(s) to obtain a smooth surface of the tablet and/or to further enhance the
stability of the tablet during packaging and transport. Such a tablet coating layer may
further comprise additives like anti-tacking agents, colorants and pigments or other
additives to obtain a tablet of good appearance.

25 The dosage forms are suitable for oral administration. The dose will depend on the nature
and severity of the disease to be treated. The dose may also vary according to the age, body
weight, and response of the individual patient. Children and patients with liver diseases as
well as patients under long term treatment will generally benefit from doses that are
30 somewhat lower than the average. In the treatment of severe conditions higher doses than
average may be used.

Int. Patent- och reg.verket

9

1999 -06- 22

Preferably, a dosage form comprising for instance 1 - 100 mg of omeprazole or S-omeprazole will be administered once a day. Suitable doses comprise preferably 10 - 80 mg. The dosage form may be administered together with other suitable drugs, such as 5 antibacterial compound(s), NSAID(s), motility stimulating agents, and/or antacids.

Examples

The following examples describe the invention more in detail without restricting the scope 10 of the invention.

Example 1

Core materials in the form of pellets made by extrusion and spheronization.

15 The following compositions were used to prepare core materials;

<u>Compound</u>	Pellets A		Pellets B		Pellets C	
	<u>Amount</u> (g)	<u>% of dry</u> <u>pellets</u>	<u>Amount</u> (g)	<u>% of dry</u> <u>pellets</u>	<u>Amount</u> (g)	<u>% of dry</u> <u>pellets</u>
Omeprazole	40.0		40.0		40.0	
Low-substituted Hydroxypropyl cellulose	82.0	20.6	-	-	84.0	21.0
Polyvinyl pyrrolidone crosslinked micronized	-	-	84.0	21.0	-	-
Microcrystalline cellulose PH 101	58.0		60.2		78.4	
Mannitol powder	136.0		115.0		136.5	
Sodium chloride (<0.20 mm)	60.0		20.0		40.3	

1999-06-22

Trisodium phosphate*	20.0	4.8	-	-	-	-
Disodium hydrogen phosphate*	-	-	-	-	20.0	5.0
Arginine	-	-	80.0	20.0	-	-
Sodium lauryl sulphate	2.0		0.8		0.8	
Water purified	170	-	151	-	199	-

Total weight of dry subst. 418 400 400

* In this example the amounts for all phosphates are indicated as free of crystal water.

The powders were mixed and then wetted with the granulating solution. When needed extra water was added afterwards, until total amount added water corresponded to the value given in the table above. The wet mass was subjected for extrusion through a screen having 1.0 mm in diameter apertures. The strings obtained were shaped to pellets in a spheronizer operated at 350 rpm. The pellets were dried in a fluid bed apparatus with inlet air temperature set to 50 degrees Celsius.

10

Granulating liquid used for composition A was 2.72 g of the trisodium phosphate and all the sodium lauryl sulphate dissolved in 50 grams of the water.

15

Granulating liquid used for composition B was 10.0 g of the arginine and all the sodium lauryl sulphate dissolved in 100 grams of the water.

20

Granulating liquid used for composition C was 8.06 g of the disodium hydrogen phosphate and all the sodium lauryl sulphate dissolved in 100 grams of the water.

Remark: Only parts of composition B were possible to get through the extruder, however material for further experimentation was obtained.

11

1999-06-22

Example 2

Core material in the form of pellets prepared by layering technique.

A drug containing suspension was made according to the composition below;

<u>Compound</u>	<u>Amount</u>
Omeprazole	219 g
HPMC, 6 cps	39.8 g
Disodiumhydrogen phosphate	42.9 g
Polysorbate 80	4.8 g
Purified water	919 g

5

First the polysorbate 80 was dissolved in the water. Then the phosphate was dissolved during stirring. Then the HPMC was dissolved whereafter the drug was suspended in the obtained solution. The suspension was sprayed onto 150 g of sugar spheres (Non-pareil) in a fluidized bed. The weight of the obtained product was 355 g and the omeprazole content
10 was 456 mg/g.

A suspension containing swellable substance was prepared according to the following composition;

	%
Cross-linked polyvinyl pyrrolidone micronized (Kollidon CL-M)	187.8 g 41*
Hydroxypropylcellulose L (HPC-L from Nisso)	46.9 g
Talc	140.8 g
EtOH (99.5%)	1500 g

* % w/w of core material not including starter seed.

15

HPC-L was dissolved in ethanol during stirring, then the talc and swelling agent Kollidon CL-M was added. The suspension was sprayed onto 130 g of the drug-layered spheres as

1999-06-22

12

prepared above in a Wurster equipped fluidized bed until the omeprazole content of the obtained core material was 130 mg/g. The weight of the obtained product was 455 g.

Example 3

5 Membrane coated pellets.

The core material from Example 2 was coated in a fluid bed apparatus with an ethyl cellulose solution having talc suspended therein. The composition of the suspension used was:

10

<u>Substance</u>	<u>Amount</u>	<u>% of dry membrane</u>
Ethyl cellulose N-10	13.5 parts	30%
Ethanol (99.5%)	1455 parts	-
Talc	31.5 parts	70%
Total	1500 parts	100%

80 grams of core material from example 2 was coated with this suspension until the omeprazole content was 107 mg/g.

15

Example 4

Test of the prepared membrane coated pellets.

The prepared membrane coated core material was tested for gastric acid resistance and dissolution as described below.

20

Test for gastric acid resistance

The pellets were tested for gastric acid resistance by immersing them in 0.1 M HCl for 2 hrs and the determining the remaining drug fraction. The fluid phase (the HCl) had an

addition of 0.1 g/liter of sodium lauryl sulphate as wetting agent. The remaining drug fraction was 96%.

Test for dissolution

- 5 Dissolution of active substance was tested accordingly, first pellets were immersed in the test-fluid described above for 2 hrs, then buffer components (phosphate salts) were added to change the pH to 6.8.

Samples of the dissolution medium were withdrawn and analyzed with HPLC at the given time intervals. Results;

10

<u>Time , Hrs</u> (after 2hrs of pre-exposure in acid medium)	% Dissolved

Claims

1. An oral dosage form comprising a core material coating layered with a semipermeable membrane wherein the core material comprises an active ingredient selected from the group of omeprazole, an alkaline salt thereof, *S*-omeprazole and an alkaline salt thereof, one or more alkaline additives, one or more swelling agents, and optionally pharmaceutically acceptable excipients.
2. A dosage form according to claim 1 wherein the active ingredient is omeprazole.
10
3. A dosage form according to claim 1 wherein the active ingredient is a magnesium salt of omeprazole having a crystallinity of more than 70% determined by X-ray powder diffraction.
- 15 4. A dosage form according to claim 1 wherein the active ingredient is magnesium salt of *S*-omeprazole.
5. A dosage form according to claim 1 wherein the core material comprises a sugar sphere layered with the active ingredient, one or more alkaline additives, one or more swelling agents and optionally pharmaceutically acceptable excipients.
20
6. A dosage form according to claim 1 wherein the dosage form comprises individual pellets of the core material layered with a semipermeable membrane.
- 25 7. A dosage form according to claim 1 wherein the core material comprises a further component in the form of an osmotic agent.
8. A dosage form according to claim 1 wherein the alkaline additive is an agent selected from the group of compounds that give a pH of not less than 8.5 when measured in a 2%
30 w/w water solution/dispersion with a pH-measuring electrode.

1999-06-22

9. A dosage form according to claim 8 wherein the alkaline additive is an agent selected from the group of disodium hydrogen phosphate, trisodium phosphate, arginine and talc.
- 5 10. A dosage form according to claim 1 wherein the alkaline additive is present in an amount of approximately 5 to 35 % by weight of the core material excluding the weight of an optional sugar sphere.
- 10 11. A dosage form according to claim 1 wherein the alkaline additive is present in an amount of 15 to 35 % by weight of the core material excluding the weight of an optional sugar sphere.
- 15 12. A dosage form according to claim 8 wherein the swelling agent is selected from the group of crosslinked polyvinyl pyrrolidone, crosslinked sodium carboxymethylcellulose, sodium starch glycolate and low-substituted hydroxypropyl cellulose (L-HPC).
- 20 13. A dosage form according to claim 1 wherein the swelling agent is present in an amount of approximately 20 to 60 % by weight of the core material excluding the weight of an optional sugar sphere.
- 25 14. A dosage form according to claim 1 wherein the swelling agent is present in an amount of 30 to 50 % by weight of the core material excluding the weight of an optional sugar sphere.
15. A dosage form according to claim 1 wherein the semipermeable membrane comprises a water insoluble polymer and a modifying agent such as talc or fumed silica.
- 30 16. A dosage form according to claim 1 wherein the water insoluble polymer is selected from the group of ethylcellulose, cellulose acetate, polyvinyl acetate, and ammonio methacrylate copolymer type A and type B.

17. A dosage form according to claim 1 wherein the semipermeable membrane comprises a modifying agent and a water insoluble polymer in a ratio of between 90:10 and 50:50.

5 18. A process for the manufacture of a dosage form as defined in claim 1, wherein a core material is formed comprises an active ingredient selected from the group of omeprazole, an alkaline salt thereof, S-omeprazole and an alkaline salt thereof, one or more alkaline additives, one or more swelling agents, and optionally pharmaceutically acceptable excipients, the core material is coating layered with a semipermeable membrane.

10 19. Use of an oral pharmaceutical dosage form as defined in any of claims 1 - 17 in the manufacture of a medicament with improved inhibition of gastric acid secretion.

15 20. Use of an oral pharmaceutical dosage form as defined in any of claims 1 - 17 in the manufacture of a medicament with improved therapeutic effect in the treatment of gastrointestinal disorders associated with excess acid secretion.

20 21. A method for improving inhibition of gastric acid secretion which comprises administering to a patient in need thereof, an oral pharmaceutical dosage form as defined in any of claims 1 - 17.

25 22. A method for improving the therapeutic effect in the treatment of gastrointestinal disorders associated with excess acid secretion which comprises administering to a patient in need thereof, an oral pharmaceutical dosage form as defined in any of claims 1 - 17.
